

ABSTRACT OF THE DISCLOSURE

An electronic device comprising a semiconductor chip which is fixed to the mounting face of a wiring board through an adhesive and in which external
5 terminals are electrically connected with electrode pads of the wiring board through bump electrodes. Recesses are formed in the electrode pads, and in the recesses the electrode pads and the bump electrodes are connected. The electrode pads are formed over the
10 surface of a soft layer, and the recesses are formed by elastic deformation of the electrode pads and the soft layer.
